

ENCE 353: An Overview of Structural Analysis and Design

Mark Austin

Fall Semester 2022

Outline

- Objectives of Structural Engineering
- A little history
- Structural Engineering Process
- Types of loads
- Types of structures
- Civil Engineering Materials
- Load paths in structures
- How can structures fail?
- Summary

Objectives of Structural Engineering

Structural engineering is ...

... the field of engineering particularly concerned with the design of economical and efficient load-bearing structures.

Within civil engineering, it is largely ...

... the implementation of mechanics to the design of the large structures that are fundamental to basic living, such as buildings, bridges, walls, dams, and tunnels.

Structural design is ...:

... the process of determining location, material, and size of structural elements to resist forces acting in a structure

Objectives of Structural Engineering

Structural engineers need to design structures that ...

... do not collapse or behave in undesirable ways while serving their useful functions.

The efficient use of funds and materials to achieve these structural goals is also a major concern.

Structural engineers work closely with geotechnical engineers, architects, construction managers, and transportation engineers, ME/EE, to name only a few.

How do I become a Structural Engineer?

Apprentice structural engineers may design ...

... simple beams, columns, and floors of a new building, including calculating the loads on each member and the load capacity of various building materials (steel, timber, masonry, and concrete).

An experienced engineer would tend to design more complex structures, such as multistory buildings or bridges.

It is in the design of these more complex systems that a structural engineer must draw upon creativity -- this will be part design and part art -- in the application of mechanics principles.

A Little History

Exemplars of Early Work

- Great Pyramid of Giza, Egypt (20 year construction; finished 2556 BC).
- The Parthenon in Ancient Greece (447-438 BC).
- Construction of the Great Wall of China (220 BC).
- The Romans developed civil structures throughout their empire, including especially aqueducts, insulae, harbours, bridges, dams and roads.

A Little History

Year	Milestone
1854	Bessemer invents steel converter.
1849	Monier develops reinforced concrete.
1863	Siemens-Martin open hearth process makes steel available in bulk.

A Little History

Early Skyscrapers

Skyscrapers (1890s) create habitable spaces in tall buildings for office workers.

Enablers	Example: Empire State Building
<ul style="list-style-type: none">● New materials → design of tall structures having large open interior spaces.● Elevators (1857) → vertical transportation building occupants.● Mechanical systems → delivery of water, heating and cooling.● Collections of skyscrapers → high-density CBDs/commuter society.	

A Little History

Exemplars of Work from the 1800s and 1900s

From the 1800s	From the 1900s
Erie Canal (1825)	New York City Subway (1904)
Transcontinental Railroad (1869)	The Panama Canal (1914)
Brooklyn Bridge (1883)	Holland Tunnel (1927)
Washington Monument (1884)	Empire State Building (1931).
	Hoover Dam (1936).
	Golden Gate Bridge (1937)
	Interstate Highway System (1956)

Source: Celebrating the Greatest Profession, Magazine of the American Society of Civil Engineers, Vol. 72, No. 11, 2002.

Infrastructure Investment

New infrastructure is **very expensive**:

A few statistics:

US: Post World-War II (1950-1970): 3% of Gross Domestic Product (GDP)

US: 1980-present: 2% of GDP.

China: 5% GDP.

India: 9% GDP.

Politicians are **eager to talk up** Infrastructure Investment , but **very slow to deliver**

Delay, delay, delay

Bangkok, Thailand

Looking Ahead

World population growth

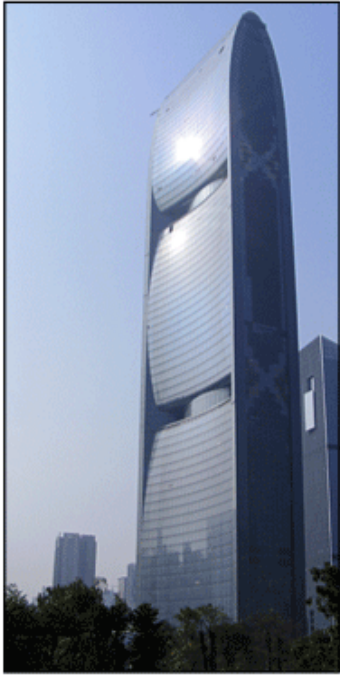

Fertility rates are declining, the United Nations says, but not fast enough to stop population growth. The U.N.'s medium-level projection is for the world's population to reach 9.2 billion by 2050 but still more than 3 billion higher since the turn of the century. Population activists say that's too much for the world to handle.

Increasing Population → Increased Demand on Limited Resources → Increasing need for improvements to system efficiency.

Looking Ahead

Example. Engineering Modern Skyscrapers

Enablers	Example: Pearl River Tower
<ul style="list-style-type: none">● High performance structure designed to produce as much energy as it consumes.● Guides wind to a pair of openings at its mechanical floors.● Winds drive turbines that generate energy for the heating, ventilation and air conditioning systems.● Openings provide structural relief, by allowing wind to pass through the building.	

Structural Design Process

- Determine types **magnitudes** of **loads and forces** acting on the structure
- Determine structural context
 - geometric and geological information
 - cost / schedule / height/ etc. limitations
- Generate **alternative structural systems** (e.g., moment resistant frame, materials selection),
- **Analyze one or more alternatives**
- Select and perform detailed design
- Implement (usually done by contractor)

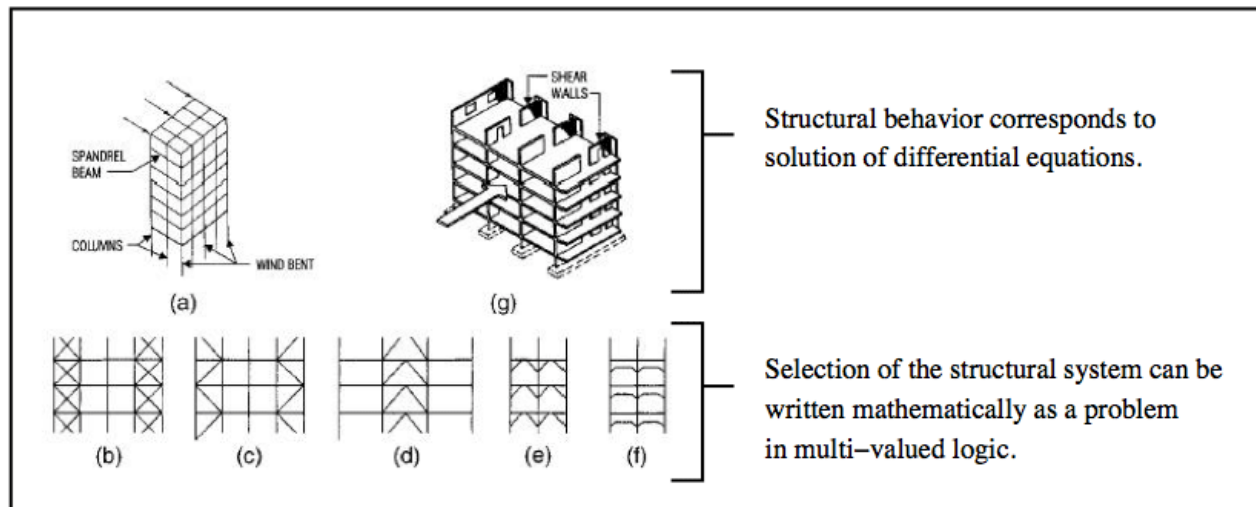

Note: **New structural systems** may also require an **experimental testing** phase to **verify behavior** and **system performance**.

Formal Approach to Structural Design

Formal Approaches to Behavior Modeling and Decision Making

Appropriate formalisms depend on the design domain of interest.

- Physical aspects of behavior are often characterized by differential equations.
- Logical aspects of system design can be captured by binary and multi-valued logic variables and boolean equations.

Formal Approach to Structural Design

Structural Behavior

Time-dependent behavior corresponds to solutions of:

$$[M] \frac{d^2 x}{dt^2} + [C] \frac{dx}{dt} + [K] x = P(t). \quad (1)$$

Here,

- M, C, and K are $(n \times n)$ matrices,
- x is a $(n \times 1)$ vector of displacements,
- P(t) is a vector of external loads applied to the structural degrees of freedom.

Design Parameters

- Selection of the best structural system (e.g., braced system) from a list of options.
- Size of the beams, columns, and bracing (if required).

Types of loads

- Dead loads
- Live loads
- Dynamic loads (e.g., trains, equipment)
- Wind loads
- Earthquake loads
- Thermal loads
- Settlement loads

Dead Loads

- weight of the structure itself
 - floors, beams, roofs, decks, beams/stringers, superstructure
- loads that are “always there”

Live Loads

- People, furniture, equipment
- Loads that may move or change mass or weight
- Minimum design loadings are usually specified in the building code

Dynamic Loads

- Moving loads (e.g., traffic)
- Impact loads
- Gusts of wind
- Loads due to cycling machinery

Load Example: Water in a dam

Earthquake Loads

- Structure loaded when base is shaken
- Response of structure is dependent on the **frequency content** and **magnitude** of **ground motion**.
- When frequencies of ground motion match with natural frequency of structure – **resonance** leads to **amplified displacements**.

Fixed-Base versus Base-Isolated Response

Fixed Base

Isolated

4: Seismic response of the building

Two Applications of Base Isolation

Settlement

Note: See link on class web page to article on Settlement of Millennium Tower in San Francisco.

...structure, I accepted the appointment in spite of my advanced age, then 80. I was determined to see that the Tower survived.

The Committee was constituted as follows:

Fig. 2: Soil profile

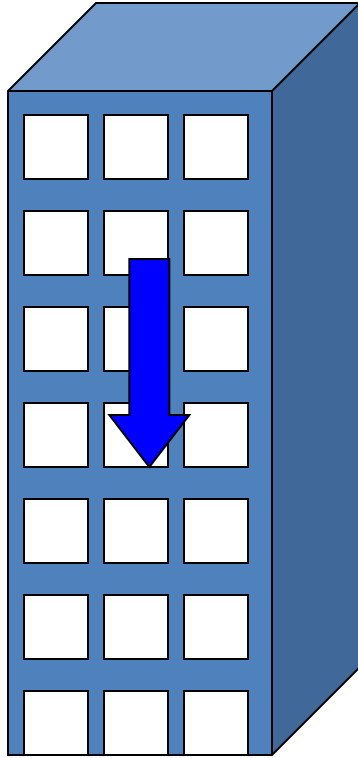

Fig. 3: Settlement and soil pressure

Sinking of Coastal Cities

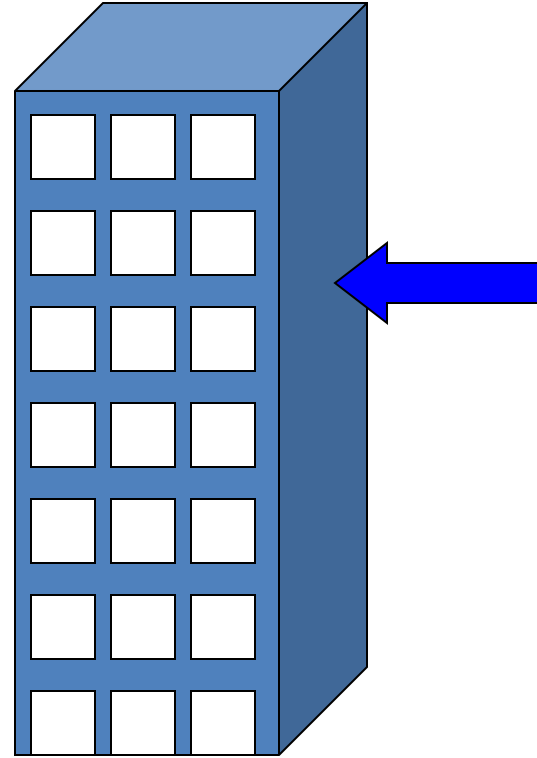

Emerging problem that will cause damage to buildings and urban infrastructure, increase the risk of flooding, and disrupt water supply systems.

Forces Acting in Structures

Vertical: Gravity

Lateral: Wind, Earthquake

Global Stability

Sliding

Overturning

Forces in Structural Elements

Tension

Compression

Forces in Structural Elements (cont.)

Some Types of Structures

- Arch
- Planar Truss
- Beam/Girder
- Flat plate
- Braced and Rigid Frames
- Folded Plate and Shell Structures
- Cable Suspended Structure

Arch

Design objective: Structure needs to work and be aesthetically pleasing!!

Analysis objective: What shape should the arch be so that forces can be transferred to the foundation through compression mechanisms alone?

Arch Bridges are currently In Vogue

Frederick Douglass Memorial Bridge, Washington DC (2017-2022)

Science World,
Vancouver, Canada.

Truss

- Combination of square and triangle
 - Both vertical and lateral support

Planar Truss

Forces in Truss Members

Three-Dimensional Truss Structure at BWI

Effelsberg 100-m Radio Telescope, Germany

Beam/Girder

New Computer Science Building at UMD (2017)

Frames

Braced

Rigid

Frames

Frame

Analysis objective: We want to compute the distribution of forces – axial, bending moment, shear forces – throughout the structure.

What are the displacements?

Will the frame structure be stable?

Flat Plate

Folded Plate

Shells

Circular Shell Structure

Lattice Shell Structure

Cable Suspended Structure

Analysis objectives What are the **forces** in the cable structure? How will the cable **profile shape** change with different **distributions of live load**? What are the **bending moments** in the bridge deck?

WORLD RECORDS
 World's Longest unsupported (free) span for a lift of this kind in the world
 World's Highest lift of its kind
 World's Longest continuous lift system

TECHNICAL DETAILS
SPEED 7.5 metres per second
CROSSING TIME 11 minutes
FREQUENCY 1 cabin departs every 49 seconds
TOTAL DISTANCE 4.4 km (2.73 miles)
LENGTH OF UNSUPPORTED SPAN 3.024 km (1.88 miles)
HIGHEST POINT 436 metres (1,427 feet)
NUMBER OF CABINS 28
CAPACITY OF CABINS 24 seated, 4 standing
TOTAL LIFT CAPACITY 4,100 passengers per hour
NUMBER OF TOWERS 4 (2 on each mountain)
HEIGHT OF TOWERS 35 - 65 metres
TRACK ROPES (2) 56 mm diameter, 4600 metres long
HAUL ROPES (1) 46 mm diameter, 8850 metres long

Power Transmission Lines

Cable Stayed Bridge

Structural Components

- Beams
- Girders
- Columns
- Floors
- Foundations

Load Path

Overview of Structural Behavior

Depends on:

- Material properties (e.g., steel, concrete).
- Structural stiffness (e.g. axial stiffness, bending stiffness)
- Structural strength (e.g., ultimate member strength).

Design challenges (**many tradeoffs to consider**):

- If the **structural stiffness is too low**, then the **displacements will be too large**,
- In dynamics applications a **high structural stiffness** may **attract high inertia forces**.
- If the **structural strength is too low**, then the structural system may **fail prematurely**.

Engineering Properties of Materials

- Steel
 - Maximum stress: 40,000 – 120,000 lb/in²
 - Maximum strain: 0.2 – 0.4
 - Modulus of elasticity: 29,000,000 lb/in²
- Concrete
 - Maximum stress: 4,000 – 12,000 lb/in²
 - Maximum strain: 0.004
 - Modulus of elasticity: 3,600,000 – 6,200,000 lb/in²
- Wood
 - Values depend on wood grade. Below are some samples
 - Tension stress: 1300 lb/in²
 - Compression stress: 1500 lb/in²
 - Modulus of elasticity: 1,600,000 lb/in²

Types of Stress-Strain Behavior

(a) Linear Elastic

(b) Non-linear Elastic

(c) Elastic-plastic

(d) Non-linear Plastic

Engineering Properties of Structural Elements

- Strength

- Ability to withstand a given stress without failure

- Depends on type of material and type of force (tension or compression)

Tensile Failure

Compressive Failure

Types of Structural Elements – Bars and Cables

Bars can carry either tension or compression

Cables can only carry tension

Types of Structural Elements – Beams

Stiffness of Different Structural Shapes

Stiff

Stiffer

Stiffest

Providing Stability for Lateral Loads

Racking Failure of Pinned Frame

Braced Frame

Infilled Frame

Rigid Joints

Failure Mechanisms

Structural failure refers to **loss in the load-carrying capacity** of a component or member within a structure.

Failure is initiated when the material is stressed to the strength limit, thus causing fracture or **excessive deformations**.

Ultimate failure is usually associated with **extreme events**.

The structural engineer needs to **prevent loss of life** by prohibiting total collapse of the structural system.

Failure due to Dynamic Instability

Failure to understand aeroelastic flutter can be catastrophic.

The Tacoma Narrows bridge opened in July 1940 and collapsed a few months later (November 1940) in a 40 mph wind.

Failure completely changed the way in which suspension bridges are analyzed and designed.

America's Infrastructure Crisis

Two key problems:

- Much of America's infrastructure was built post World War II -- it's now 50-60 years old, and being attacked by decay and neglect.
- The US population is growing! This puts additional demands on infrastructure.

Quote from W.P. Henry, former president of ASCE:

Our infrastructure is in crisis mode ...

- ... how many more people must die needlessly because we do not take proper care of our infrastructure?

Poster Child: Collapse of the Minneapolis bridge over 135W.

The 40-year old steel deck truss crossing had been considered **structurally deficient since 1990**, but engineers with the Minnesota Department of Transportation had **not believed** the bridge to be in danger of **imminent collapse**.

Thirteen commuters were killed and more than 100 were injured on August 1, 2007.

Failure due to lack of Ductility in Concrete Columns

Frame buildings can have also be built with concrete columns and beams (as opposed to steel)

1971 San Fernando earthquake showed that many concrete frames were brittle

Potential for collapse at drifts of about 0.01 (lower than for steel buildings)

There are thousands of these buildings in California and occupants have not been notified

Olive View Hospital
M 6.7 1971 San Fernando Earthquake

Northridge 118 FWY

Example of failure of a brittle concrete column (pre-1975 code)

Example of “ductile” behavior of concrete columns. Although the parking structure performed poorly, the exterior columns did not fail.

Mexico City Earthquake, 1996

CUREe

14-story neighbor, Pino Suarez complex *photo credit: Henry Deenkolb*

1996

Soil liquefaction

stable soil

Building stands erect on stable soil.

Loosely packed grains of soil are held together by friction. Pore spaces are filled with water.

liquefied soil

Shaking and tilting causes some structures to fail.

Building tilts and sinks as soil stability declines.

Shaking destabilizes the soil by increasing the space between grains. With its structure lost, the soil flows like a liquid.

1999

Sometimes you are simply in the wrong place at the wrong time ...

Christchurch, New Zealand, 2011.

Richter Magnitude = 6.3

Failure of the Christchurch Cathedral...

Sometimes extreme events spur real innovation!

Update for 2016

Richter Magnitude = 7.8 – this is 32 times more energy than the 6.3 magnitude earthquake in 2011.

© Tonkin+Taylor/Twitter

Summary

- Structural Engineering:
 - Identifies loads to be resisted
 - Identifies alternatives for providing load paths (arch, truss, frame, ...)
 - Designs structure to provide safe and economical load paths (material, size, connections)
 - To be economical and safe, **we must be able to predict what forces are in structure.**
