#### Homework 2

Due: 11.59 pm, October 6, 2023

### **Question 1: 5 points**

Using method of sections, determine the forces in members A, B, and C. State if the members are in tension or compression.

$$\sum F_{x} = 0 \to F_{A} + \frac{6}{\sqrt{72}}F_{B} + \frac{6}{\sqrt{45}}F_{C} = 0$$

$$\sum F_{y} = 0 \to \frac{6}{\sqrt{72}}F_{B} - \frac{3}{\sqrt{45}}F_{C} - 9 = 0$$

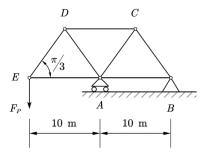

$$\sum M_{BC} = 0 \to F_{A}(6) - 3(6) - 3(12) = 0$$

$$F_{A} = 9 \text{ kips, } F_{B} = 4.24 \text{ kips, } F_{C} = -13.42 \text{ kips}$$

Members A and B are in tension, and member C is in compression.

### **Question 2: 10 points**

If the maximum force that any member can support is 17 kips in tension and 12 kips in compression, determine the maximum force  $F_P$  can be applied on the following structure (all the angles are  $\pi/3$ ).

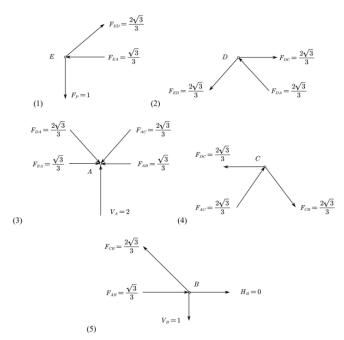

Use method of superposition for this linear elastic structure and assume  $F_P = 1 \ kips$ , the vertical reaction forces at A and B are:

$$\sum {\rm M_A} = 0 \rightarrow V_B = 1 \, kips \, (downward)$$

$$\sum F_y = 0 \rightarrow V_A = 2 \ kips \ (upward)$$

Use the method of joint to calculate the force in each member starting from joint E:

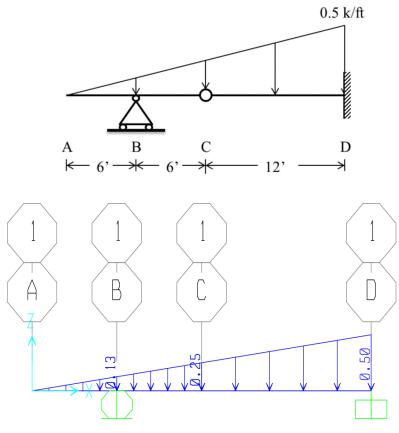

Hence, the maximum tension and compression forces are the same and have the value of  $\frac{2\sqrt{3}}{3}$ 

Therefore, the compression controls, and the maximum possible value for  $F_P$  is calculated as follows:

$$F_P = \frac{12}{2\sqrt{3}} * 1 = \frac{18}{\sqrt{3}} = 6\sqrt{3} = 10.4 \text{ kips}$$

# **Question 3: 15 points**

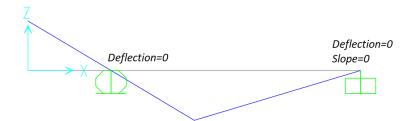

Determine the shear and moment throughout the beam. Draw the shear and moment diagrams for the beam. Draw the deflected shape of the beam.

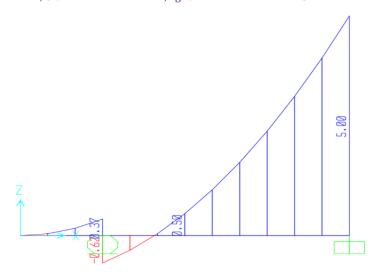

Reactions:  $R_B = 1 \text{ kips}$ ,  $R_D = 5 \text{ kips}$ 

# Deflected Shape:

Shear Diagram:  $V_A=0$ ,  $V_{B,left}=0.375$  kips,  $V_{B,right}=-0.625$  kips,  $V_C=0.5$  kips,  $V_D=5$  kips

Moment Diagram:  $\rm M_A=0$ ,  $\rm M_B=-0.75$  kips. ft,  $\rm M_C=0$ ,  $\rm M_D=-30$  kips. ft
